

Resource Investor Monthly

The Resource Investor Monthly is produced by Ascenta Capital Partners Inc., a leading provider of outsourced investor relations to public companies in Western Canada. Among Ascenta's client roster are a number of high-quality junior resource companies that are active throughout the world. The Resource Investor Monthly provides a brief overview of current developments relating to these companies. This information is not intended to be complete and does not constitute an offer or solicitation to buy or sell any securities discussed herein in any jurisdiction. Investors should obtain advice based on their own individual circumstances before making an investment decision. For additional information on any one of these companies, readers are encouraged to contact the investor relations representative noted or visit the company's website.

Goldminco Files Three NI-43-101 Reports

September 13, 2006 - Goldminco Corporation (TSXV: GCP) announced it had filed NI 43-101 Reports for three projects - the Dam, Discovery Ridge and Browns Creek.

The NI 43-101-compliant technical reports were prepared by Cube Consulting Pty Ltd. and can be viewed in their entirety under the company's SEDAR profile. Select reported resources for each project are as follows:

Discovery Ridge

<i>Indicated:</i>	4.2 million tonnes 1.2 g/t gold 170,000 gold ounces
<i>Inferred:</i>	4.5 million tonnes 1.2 g/t gold 180,000 gold ounces 0.5 g/t gold cut-off

Browns Creek

<i>Measured: 1</i>	1.0 million tonnes 5.2 g/t gold 165,000 gold ounces
<i>Indicated:</i>	0.4 million tonnes 3.4 g/t gold 40,000 gold ounces
<i>Inferred:</i>	0.6 million tonnes 3.1 g/t gold 60,000 gold ounces 2.0 g/t gold cut-off

Dam

<i>Indicated:</i>	20.2 million tonnes 0.6 g/t gold 0.41% copper 753,000 equiv. gold ounces
<i>Inferred:</i>	7.5 million tonnes 0.53 g/t gold 0.37% copper 250,000 equiv. gold ounces 0.2 g/t gold cut-off

Goldminco is a junior mining exploration company registered in Canada with headquarters in West Perth, Western Australia. Goldminco holds over 2,000 sq km of mining tenements in the highly prospective Lachlan Fold Belt (LFB) of New South Wales, Australia. This is one of the largest holdings in the LFB, host to the world class Cadia group of deposits. The tenements are predominately 100%-owned and operated by Goldminco and have a range of active projects for gold and porphyry copper-gold.

Scintillometer values from 20 locations over the 300-metre length of the zone range from >10,000 to 2,700 cps over outcrop, with seven samples giving >10,000 cps using the GRS 110 scintillometer, which measures total counts per second of gamma radiation. A map of the sample locations can be viewed in the "News" section on the company's website: www.silverspruceresources.com.

The discovery of this zone has prompted the acquisition of 600 claims (150 sq km) tied on to the north and west of the original CMB NW block. The new claims protect the northern extension of the anomalous area in addition to a series of airborne radiometric anomalies located by Brinex and partners in the 1970s, which lie just to the north of Snegamook Lake. The first 300 claims, tied on to the north of the original CMB NW block, were flown by Fugro Airborne surveys as an extension of an earlier radiometric/magnetic survey done in early September and results are pending. Ground follow up will take place once the data has been received and anomaly prioritization has been completed.

The newly acquired claims form part of a Silver Spruce-Universal Uranium Ltd. (TSXV: UUL) joint venture and are subject to the agreement between the two companies that covers the CMB and Seal Lake areas. Under the terms of the agreement, Universal can earn a 60% interest in the properties by spending \$2 million on exploration over a three-year period with Silver Spruce as the operator during the earn-in period.

Silver Spruce Resources Inc. is a junior mining exploration company primarily focused on uranium in the CMB of Labrador, Canada. With over 5,000 claims totalling more than 1,250 square kilometres, Silver Spruce is the second largest land holder in one of the world's premier emerging uranium districts.

Discovery of Mineralized Zone in Central Mineral Belt NW Area, Labrador

September 12, 2006 - Silver Spruce Resources Inc. (TSXV: SSE) announced it has located an anomalous radioactive zone in the course of ground follow up on airborne targets on the Central Mineral Belt (CMB) NW claim group. Radiometric target CMB NW 2, south of the Kanairiktok River, has been located as a strongly radioactive zone on the ground over an area of approximately 300 by 50 metres.

Great Quest to Continue Exploration on TD Concession

September 12, 2006 - Willis W. Osborne, President of Great Quest Metals Ltd. (TSXV: GQ), announced that a follow-up program on the TD concession will commence in mid-September. The TD concession is one of the Bourdala group of concessions in western Mali, West Africa. It is the area of extensive orpaillage where more than 1,500 women orpailleurs (hand-miners) were working last summer.

North of the orpaillage are two diorite dykes 26 to 35 metres apart that strike north-south. The area of orpaillage covers the projection of these dykes to the south and a large, very old pit occurs 15 metres west of the western dyke. Drill hole 02TD intersected 7.0 metres of 4.34 g/t gold directly below this pit in the spring of 2003. One small pit was dug to a depth of 14.5 metres during the 2006 program. A sample of diorite from the bottom of this pit assayed 438 ppb gold and three samples of schist or siltstone averaged 1,178 ppb or 1.18 g/t gold.

There is another area of old orpaillage 250 metres east of this area. Some highly weathered fragments of rhyodacite were discovered in this area that assayed 200 ppb gold. Because of the association of gold with rhyodacite and diorite in Great Quest's Kenieba concessions to the south, these areas are of great further interest. During the autumn 2006 program, both areas will be pitted and sampled in order to more fully define the geology and the association with gold mineralization while Great Quest awaits the final report on last summer's IP program.

Great Quest Metals Ltd. is a Vancouver-based gold company focused on the acquisition, exploration and development of gold prospects in

Mali, West Africa. The company began focusing on Mali in 1998, and now holds concessions covering 339 sq km within a 25- by 200- kilometre belt in western Mali that hosts 30 million ounces of gold resources.

Golden Band Confirms the Continuity of Very High Gold Grades at the EP Deposit

September 26, 2006 - Golden Band Resources Inc. (TSXV: GBN) announced the standard fire assay results of a drilling program carried out on its 100%-owned EP gold deposit located in Northern Saskatchewan. In total, 16 shallow holes were drilled and all returned very encouraging gold values. Two holes, EP-93 and EP-95, returned spectacular gold values of 316 g/t over 1.4 metres and 271 g/t gold over 2.6 metres. The objective of this work was to in-fill at an approximate spacing of 7.5 metres between previous drillholes that encountered similar high grades of up to 200 g/t gold.

The current program has successfully confirmed these high-grade gold values are continuous at this detailed scale. All holes drilled to date on the high-grade portion of the EP deposit, in addition to assay data, can be viewed on Golden Band's website: www.goldenbandresources.com.

The sixteen EP deposit drill holes (483.4 metres total) were completed between July 22 and August 6, 2006, on the zone located 200 metres east of Golden Band's Komis gold deposit in the Upper Waddy Lake area of northern Saskatchewan. Each hole is 63.5 mm in diameter (HQ core) and is approximately 30 metres in length. Between 2003 and 2005, Golden Band drilled 60 short, vertical drillholes that confirmed the existence of a shallow (15 to 20 metres below surface), high-grade, but

localized gold zone over an area of approximately 50 by 50 metres.

The primary gold mineralization of the EP deposit is associated with sub-vertical extensional quartz veins and a sub-horizontal shear zone within a flat, south dipping, intermediate dyke of two to five metres in thickness that intrudes andesitic lavas. The EP gold mineralization is confined to one or more fault gouges within these sub-horizontal shear zone(s) and the occasional 10- to 30-centimetre-wide dirty quartz layer. Coarse-grained gold, quartz, and other mineral grains (bornite, native copper, and pyromorphite [lead chlorophosphate]) are found within both the fault gouge and the quartz layers.

It is interpreted that the setting of the primary gold mineralization of the EP deposit is similar to the nearby Komis deposit, which is controlled at the intersections of steep, north dipping, east-west oriented granodiorite dykes and swarms of north-south extensional quartz veins. High-grade values in excess of 100 g/t gold exist locally in the Komis deposit.

Golden Band Resources is a Saskatchewan-based resource company whose major focus is the long-term, systematic exploration and development of its La Ronge Gold Belt properties in Northern Saskatchewan.

Through a series of strategic acquisitions, Golden Band has transformed itself from a junior exploration company to an emerging producer with a gold portfolio worthy of an intermediate mining company.

Dynasty Gold Hits Gold in Red Valley Drill Program, China

September 21, 2006 - Dynasty Gold Corp. (TSXV: DYG) (FWB: D5G) announced its first drill program at the Red Valley project intersected gold mineralization in several holes. Highlights of the results included:

8 metres @ 4.19 g/t Au in hole DH020, including:

3 metres @ 9.96 g/t Au with

1 metre @ 25.85 g/t Au

12 metres @ 1.33 g/t Au in hole DH009

7 metres @ 1.91 g/t Au in hole DH004

A complete summary of the drill results can be found on Dynasty's website.

The Red Valley project is situated within the Qilian fold belt, a NW-SE trending assemblage of late Proterozoic- to Ordovician-aged sediments and volcanics. Major structural trends within the region are NW-SE, with less topographically pronounced E-W and N-E trending cross structures. Dynasty's previous exploration work identified a zone of surface alteration stretching for nearly 23 kilometres with anomalous gold, arsenic, antimony and mercury surface samples. Within this zone there are two main prospects, Red Valley and Chuancangou.

The 2006 exploration program at Red Valley is funded by AngloGold Ashanti ("AngloGold") through an equity financing completed in April (see news release dated April 10, 2006). The first diamond drill program at the property focused on the Red Valley and Chuancangou prospects, where Dynasty and its exploration partners have completed 30 diamond drill holes for a total of approximately 4500 metres of drilling. To date, the company has only received assays for twelve holes, all from the Red Valley prospect area. In addition to drilling, the program has included surface exploration, ground magnetic and IP geophysical surveys.

Dynasty Gold Corp. is a leading Canadian gold exploration company in China with three highly prospective gold properties currently being explored through partnerships with AngloGold Ashanti and Avocet Mining. Dynasty's Hatu property hosts a NI 43-101 compliant inferred gold

resource of 912,600 ounces, including 16.9 million tonnes at 1.68 g/t gold, with a 1.0 g/t gold cut-off.

Indicator Minerals Locates 95 New Kimberlite Float Occurrences at Darby

September 12, 2006 - Indicator Minerals Inc. (TSXV: IME) announced a high-resolution helicopter airborne geophysical survey had identified 15 new high-priority geophysical targets and that ground work has located a further 95 new kimberlite float occurrences.

The 2006 exploration program was designed to drill-confirm the existence of a kimberlite field at Darby and expand its limits. The largest kimberlite discovered, Iceberg, has an interpreted surface area of 11 hectares, which is supported by two drill holes collared more than 500 metres apart that intersected 220 metres and 194 metres of continuous kimberlite respectively. More than 500 kg of sample material has been sent for diamond analysis (see news release dated July 5, 2006).

The further extent of the kimberlite field was defined by conducting 5,510 line-kilometres of high-resolution heli-borne geophysical surveys that expanded previous coverage from 10% to 40% of the property. The new anomalies identified bring the total number of untested high-priority geophysical targets on the property to 23.

The new geophysical targets have signatures of up to seven hectares in surface area. Prospecting conducted across the property identified 95 new kimberlite float occurrences down-ice from associated geophysical anomalies. At least five different types of kimberlite have been recognized in the float occurrences to date based on field assessment of rock textures and mineral composition.

Float samples have been collected from nine discrete locations for micro-diamond analysis, as well as indicator mineral and petrographic studies.

In addition, a train of kimberlite float was discovered outside the airborne geophysical survey area. This float train is greater than 100 metres in width and consists of boulders up to one metre in diameter. The float is described as an olivine-rich macrocrystic kimberlite. Several coarse grained pyrope-rich mantle nodules were discovered within the float train, which was traced up-ice and terminated in an area of thick till well within the property boundary. It is expected that analysis of all of the kimberlite submitted in 2006 will be completed early in 2007.

Indicator Minerals Inc. is a Canadian exploration company focused on the discovery of economic diamond deposits. Founded in 2004, the company has assembled a highly qualified technical team experienced in worldwide diamond exploration. Indicator is exploring more than six million acres of targeted ground in the Canadian arctic and has two key projects in the Franklin District of Nunavut. Indicator's management has positioned the company to be a sophisticated player in both Canadian and international diamond exploration by forming strategic partnerships, acquiring highly prospective properties and conducting systematic and efficient exploration programs.

Mirasol Signs Exploration Agreement with Coeur d'Alene Mines

September 14, 2006 - Mirasol Resources Ltd. (TSXV: MRZ) announced the signing of a letter of intent with Coeur d'Alene Mines (Coeur) (NYSE: CDE; TSX: CDM) for the exploration of Mirasol's 100%-owned Sascha and Joaquin gold-silver projects in Santa Cruz Province, southern

Argentina. Coeur is a top-tier international silver producer whose South American operations include the Martha silver mine in southern Argentina and the Cerro Bayo silver-gold mine in southern Chile.

The letter of intent provides for an agreement to give Coeur the option to earn 51% in both projects by spending a total of US\$8 million on exploration over four years - including \$800,000 in the first year - and making cash payments to Mirasol totaling US\$800,000. After earn-in, Coeur can increase its interest to 61% by funding a bankable feasibility study. Mirasol may then elect to maintain a participatory 39% interest or permit Coeur to increase its interest to 71% by providing mine financing at commercial terms to Mirasol. Coeur will operate the exploration programs with collaboration from Mirasol. The letter of intent is non-binding and the definitive joint venture agreement is subject to approval from the Board of Directors of Coeur.

The 15.9 sq km Sascha Project area contains a 4.5 kilometre trend of classic, mineralized low-sulphidation quartz veins hosting bonanza gold and silver grades at the Sascha Main sector (see news release dated February 21, 2006). Exploration conducted by Mirasol has included a 6.4-kilometre gradient array and IP geophysical survey, trenching, detailed geological mapping and geochemical sampling. This work resulted in the discovery of high-grade gold and silver showings at surface associated with indicator textures such as "ginguro" colloform banded quartz.

Mirasol's exploration of the Joaquin Project included prospecting, geological mapping and channel geochemical sampling and confirmed the presence of high-grade gold and/or silver values at four discrete gold and silver target areas (see news releases of June 10, 2005 and January 20, 2006).

Mirasol Resources Ltd. is an exploration and development company focused on the discovery and acquisition of new, high-potential precious metals deposits in the Americas. Mirasol's exploration team is backed by extensive local experience, state-of-the art remote sensing technology and a proven record of discovery. Mirasol Argentina SRL, Mirasol's wholly-owned subsidiary, currently holds 100% of the rights to seven exploration projects covering more than 130,000 hectares in Santa Cruz Province in the Patagonia region of southern Argentina.

crowflight minerals inc.

Crowflight Completes Purchase of Used Mill for Bucko Project Development

September 21, 2006 - Crowflight Minerals Inc. (TSXV: CML) announced the conclusion of an agreement signed August 2006 to purchase a concentrator plant for the development of the Bucko Lake Nickel Deposit. Since signing the initial agreement, Crowflight has directed the confirmation of the integrity of the plant and equipment. The purchase includes the plant building, primary semi-autogenous mill, regrind ball mill, 35-tonne overhead crane, floatation cells, various cyclones and conveyances and a concentrate dryer.

The purchase of the concentrator plant is being satisfied by \$1.5 million in cash payments over a five-month period to the end of 2006, and the issuance of 1,666,667 common shares of Crowflight, subject to regulatory approval.

Crowflight expects to save approximately \$2.0 million in costs associated with the purchase, refurbishment and installation of the plant on site at the Bucko Lake Nickel Deposit, relative to the cost of new equipment as calculated in the recently completed feasibility study.

Crowflight Minerals Inc. is a Canadian junior mining exploration and development company focused on nickel, copper and Platinum Group Mineral (PGM) projects in the Thompson Nickel Belt (TNB), Manitoba and the Sudbury Basin, Ontario. Crowflight currently owns and/or has under option approximately 600 square kilometres of exploration and development properties in these areas.

In Manitoba, these properties include: (1) the Bucko Lake Nickel Deposit; (2) an earn-in option with Xstrata plc on five highly prospective properties on the TNB South Project located within 30 kilometres of the Bucko Deposit; and (3) six additional properties located 100 kilometres to the north on the TNB North Project.

In the Sudbury Basin, these properties include: (1) the 100% owned AER Kidd Project adjacent to Inco's Totten Deposit (10.1 million tonnes grading 1.5% nickel, 2.0% copper and 4.8 g/t PGM's); (2) the 100% owned Peter's Roost Property, the subject of a recent joint venture agreement with Wallbridge Mining Co. Ltd.; and (3) the Airport Property (a 50/50 joint venture with Millstream Mines Ltd.) located four kilometres south, and on-strike, with Xstrata's Nickel Rim South Deposit (13.2 million tonnes grading 1.7% nickel, 3.5% copper and 4.1 g/t PGM's).
